1. Zandar AI — Autonomous AI Security & Multi-Agent Pentest Platform

AI CYBERSECURITY · MULTI-AGENT SYSTEM

An autonomous, operator-supervised cybersecurity engine designed to run end-to-end vulnerability assessments and authorized penetration testing loops. Built on a modular **LangGraph StateGraph** architecture that coordinates **18+ containerized security binaries** (nmap, nuclei, ffuf, sqlmap, httpx, naabu, subfinder, hydra) isolated inside secure Docker runtime containers.

Features **Amazon Bedrock Multi-Model Routing** (Claude 3.5 Sonnet for tactical attack graph synthesis, DeepSeek/Qwen for script generation), backed by a **3-tier GraphRAG long-term memory** (Qdrant vector similarity + Neo4j infrastructure attack path graphs + PostgreSQL execution traces) with strict **human-in-the-loop exploit authorization gates**.

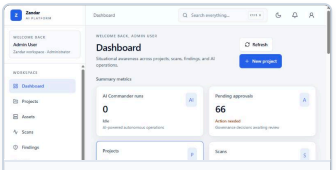

Hardened through an **11-agent, 5-dimension self-security-audit** (prompt-injection, supply-chain, secret-leakage, authorization, agent-egress) synthesized via adversarial verification — 34 ranked findings surfaced, 10 resolved and re-verified including both Critical-severity issues, the remainder tracked by priority in a living report. Ships a **bug-bounty submission mode** (HackerOne/Bugcrowd-ready exports separating oracle-verified findings from unverified ones, an out-of-scope governance gate, and a Hacktivity duplicate-detection check), and is fully **Docker-deployable** — one `docker compose up` brings the backend, frontend, and five datastores to a verified healthy state.

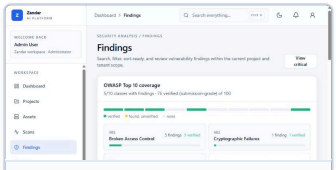

`Python` `LangGraph` `Docker (18+ Binaries)` `Amazon Bedrock` `GraphRAG (Qdrant+Neo4j)` `FastAPI` `Human-in-the-Loop` `Self-Audited Security (34 Findings)` `Bug-Bounty Export (HackerOne/Bugcrowd)` `One-Command Docker Deploy`

2. Zandar OSINT — Multi-Tier Open-Source Intelligence & Verification Engine

DATA ENGINEERING · NLP INTELLIGENCE

An enterprise-scale open-source intelligence aggregation and fact-checking platform. Implements **26 ingestion data adapters** across 3 tiers (RSS feeds, GDELT global events, YouTube Data API, Google Play Store reviews, public Telegram channels, and Wayback Machine digital archives) running on a distributed **Celery & Redis** worker cluster.

Includes an **IndoBERT hybrid sentiment & classification pipeline** (RoBERTa-based open-source models, integrated and benchmarked against a human-labeled gold set), validated at **0.894 F1 Score** on NusaX-Senti. Integrated with an automated claim verification pipeline that cross-references extracted claims against official government datasets (BPS & BMKG) for high-confidence intelligence synthesis.

`Python` `26 Data Adapters` `IndoBERT (0.894 F1)` `Celery Workers` `Redis` `PostgreSQL` `BPS/BMKG Verification`

3. Nozaracy Studio — Figma to Shopify & WordPress Bespoke Theme Engineering

THEME ENGINEERING · WEB PERFORMANCE

Full-cycle bespoke theme engineering agency playbook delivering high-performance e-commerce and corporate websites. Translates complex Figma design tokens into clean, modular, and maintainable codebases for both **WordPress (PHP theme architecture, hooks, custom post types)** and **Shopify (Liquid theme architecture, custom sections, blocks)** with **0% visual page-builder bloat**.

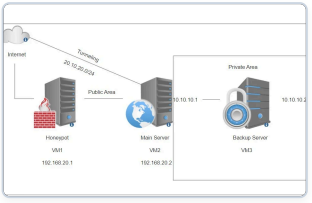

Leverages modern AI-assisted workflows for rapid component scaffolding, schema synthesis, and automated test-case generation. Rigorously verified via automated multi-viewport QA (Playwright) and deep **Core Web Vitals** optimization, consistently securing **LCP < 2.0s, CLS 0**, and **90+ Lighthouse Performance** prior to client delivery.

`Figma Token Mapping` `WordPress (PHP)` `Shopify (Liquid)` `Core Web Vitals (LCP/CLS)` `Lighthouse 90+` `Playwright QA`

4. Multi-VM Linux Security Hardening & Server Infrastructure Runbooks

LINUX SYSADMIN · NETWORK SECURITY · OBSERVABILITY

ProjectMen (3-VM Segmented Server Security Architecture — Team Lead & System Security Administrator): Designed and deployed a defense-in-depth 3-VM Linux infrastructure isolating **VM1 (Honeypot — `192.168.20.1`)**, **VM2 (Main Production Server — `192.168.20.2` / `10.10.10.1`)**, and **VM3 (Air-Gapped Backup Server — `10.10.10.2`)**. Configured **iptables DNAT** rules to transparently trap and redirect unauthorized SSH port-22 probes to the Honeypot, hardened WordPress & Roundcube Mail Server behind **UFW**, **ModSecurity2 WAF**, and SSL/TLS (HTTPS 443, SMTPS 465, IMAPS 993), locked administrative SSH behind **Port Knocking (`knockd`) + OpenVPN (`tap0`)**, and orchestrated centralized log telemetry (**Rsyslog + Promtail + Loki + Grafana**) with automated air-gapped **rsync + crontab** backups.

OS Server System Administration Runbook (8 Core Linux Services): Authored comprehensive end-to-end installation, configuration, and troubleshooting SOP documentation across 8 foundational Linux server services: **OpenSSH** (custom port & daemon hardening), **ISC DHCP Server**, **FTP & Samba** file sharing, **Apache2/Nginx** virtual hosts, **BIND9 DNS** authoritative zones, **MySQL/MariaDB** relational database administration, **Postfix/Dovecot** mail transfer, and system resource monitoring.

`Ubuntu / Debian Server` `iptables DNAT & UFW` `ModSecurity2 WAF` `Port Knocking & OpenVPN` `Grafana · Loki · Promtail` `Rsync & Crontab Backup` `BIND9 · DHCP · Samba · MySQL`
